Topic: How Business Analyst Can Add Value to IT Projects.

Title: How Business Analysts Help IT Project Succeed.

IT Projects are now used in almost every type of business. Companies use Technology to make their work easier, improve their services and give better experiences to customers. But making Software is not enough. The Customer Software should solve a real problem and should be useful for the people who will use it. This is where Business Analysis becomes important. Business Analysis helps a Company understand its actual problem before starting the Project. A Business Analyst talks to stakeholders, ask questions, Collects information and tries to understand what the business

really wants. After understanding the requirements, the business Analyst explains it to the development and Technical Teams. One of the main benefits of Business Analysis is Clear Requirements. Sometimes a Stakeholder may have an idea but may not know how to explain it properly. The Business Analyst helps convert that idea into clear requirements. For example, if a company wants to create an online learning website, the Business Analyst can find out what students and Trainers need from the website. Business Analysis also helps in better Communication. In an IT Project, many people are involved, such as business users, developers, Testers, managers and customer. Everyone may understand the project differently. The Business Analyst helps keep everyone on the same page by discussing requirements and clearing doubts. Another important value is avoiding unnecessary work.

If the team does not understand the requirements correctly, they may develop a feature that is not needed. Later, they may have to change or remove it. This can take extra time & effort. Proper discussion and requirement checking can help avoid such situation. Business Analysis also gives attention to customer needs. A project should not only satisfy the company but should also be useful for its users.

A business Analysts can understand customer problems through feedback, discussions and research. This information can help the team make the product easier and more useful. It also supports better decision-making. Sometimes there can be more than one solution to a business problem. The Business Analyst can compare the options by looking at factors such as cost, times risk and expected value. This helps

the stakeholder choose an options that is suitable for the project. Every IT project can also have some risks. Requirements may change, some features may take more time or there may be technical limitations.

A Business Analyst can identify such issues early and discuss them with the concerned people. This can help the team prepare for problems before they affect the project. Business Analysis also helps make sure that the final product is connected with the Business goal. The team should know why they are building the product what result the business expects from it. Business Analysis is helpful for IT projects. It helps us understand what the business needs and what problems it wants to solve. A Business Analyst talks to people, collect Requirements, & explains them to the team. This reduces mistakes, saves time and helps create a useful product for all users.
